

## Peer review for Group 6

### General domain model

The model is very detailed and gives a good overview of how the system should work. While it has been modeled with a lot of details and complexity it's still a understandable model. It's hard to find anything wrong really.

First thing I noticed however was the lack of attributes. I felt it makes it a bit hard to understand what the application is supposed to achieve sometimes.

For example, *BoatDirectory* does not clearly explains on what it's supposed to do or what it means. Same goes to *Boat* and *Member*.

I would suggest adding some suitable attributes to avoid misinterpretation. And change the name of *BoatDirectory* to something that explains it's "goal" better.

The direction arrows are unnecessary. It does not indicate direction of navigation in the model.

*"- It has no meaning except to indicate direction of reading the association label."*

*"- Often excluded."*

(Chapter 9, section 9.14 (figure 9.12, page 248 in the PDF)
